Pie Command Line Compiler

The command line compiler is the file "piec.dat": it was necessary to rename the executable to send it over gmail. Rename to "piec.exe" before using it.

Piec is a very simple command line compiler that accepts options in this form:

piec.exe /out:<outputfile> <source files>

For example, to compile the example Fibonacci program:

piec.exe /out:fib.exe TestSource/Fibonacci.pie

Multiple source files can be specified.

To create your own program, create a text file with the extension "pie" and compile as above. A sample "hello world" program is included in the TestSource folder along with a few other single source file example programs.
